

BREEZE CALPRO

CALPUFF is a multi-layer, multi-species non-steady-state puff dispersion model which simulates the effects of time- and space-varying meteorological conditions on pollution transport, transformation, and removal. It includes algorithms for subgrid scale effects and longer range effects. The U.S. EPA recommends its use for regulatory applications on scales of tens to hundreds of kilometers.

BREEZE CALPUFF offers a complete user graphical interface for the U.S. EPA-approved Version 5 and the advanced Version 6 of the CALPUFF modeling system, which includes:

- CALMET - a diagnostic 3-dimensional meteorological model
- CALPUFF - an air quality dispersion model
- CALPOST - a post-processing package
- Pre- and post-processors

BREEZE CALPUFF provides modelers with the tools and functionality required to perform air quality analyses that help to address both permitting, regulatory, and nuisance issues as well as perform academic research.

- Supports the U.S. EPA recently approved CALPOST 6.221
- Streamlines visibility post-processing
- Supports the U.S. EPA-approved Version 5.8 and the advanced Version 6 models
- Integrates with the BREEZE 3DAnalyst
- Models an unlimited number of sources and receptors
- Models numerous source types including point, area, volume, buoyant line, and non-buoyant line
- Models numerous receptor types including discrete Cartesian grid, polar grid, and variable density grid

Features

BREEZE CALPUFF improves productivity by offering users many advantages. The careful design of this air dispersion model enables modelers to streamline all aspects from setup to model execution to results analysis. BREEZE CALPUFF saves you time and money by minimizing duplicate data entry and data entry mistakes. BREEZE's professional staff of modelers, meteorologists, scientific software specialists, and PhDs are available to assist you with the science behind the software.

- Supports the U.S. EPA recently approved CALPOST 6.221
- Streamlines visibility post-processing
- Integrates model executables with BREEZE CALPUFF installer
- Streamlines graphical user interface for more intuitive and easier dispersion modeling
- Simplifies the setup of pre-modeling objects with a variety of utilities
- Analyze post-modeling results with multiple tools including BREEZE 3DAnalyst and the processing of sensitive receptors
- Organizes model scenarios using a skeleton and neat file structure for better file management

- Supports the U.S. EPA-approved Version 5.8 and the advanced Version 6 models
- Integrates with the BREEZE 3DAnalyst
- Models an unlimited number of sources and receptors
- Models numerous source types including point, area, volume, buoyant line, and non-buoyant line
- Models numerous receptor types including discrete Cartesian grid, polar grid, and variable density grid
- Models multiple emission scenarios simultaneously
- Models an unlimited number of buildings with integrated BPIP analysis and downwash
- Imports buildings, sources, and receptors from ISC/AERMOD input files
- Draw sources with CAD drawing tools
- Supports 7.5 DEM and 1 minute USGS DEM
- Supports three-dimensional meteorological fields as well as single station meteorology

Product Tour

CALPUFF is an advanced non-steady-state meteorological and air quality modeling system developed by ASG scientists. It is maintained by the model developers and distributed by TRC. The model has been adopted by the U.S. EPA in its *Guideline on Air Quality Models* as the preferred model for assessing long range transport of pollutants and their impacts on Federal Class I areas and on a case-by-case basis for certain near-field applications involving complex meteorological conditions.

Programs and processors

BREEZE CALPUFF enhances the basic EPA-approved programs providing modelers with more functionality and tools for analyzing results. The main components of the BREEZE CALPUFF modeling system are:

- CALMET – includes a diagnostic 3-dimensional meteorological model (considering slop flows, kinematic terrain effects, terrain blocking effects, and a divergence minimization procedure) and a micro-meteorological model for overland and overwater boundary layers
- CALPUFF – a non-steady-state Lagrangian Gaussian puff model (considering complex terrain effects, overwater transport, coastal interaction effects, building downwash, wet and dry removal, and simple chemical transformation)
- CALPOST – a post-processing package (Computation of time-averaged concentrations, deposition fluxes, and visibility impacts)

Pre- and post-processors of BREEZE CALPUFF include:

- READ62 – a meteorological preprocessor for extracting and processing upper air wind and temperature data
- SMERGE – a meteorological preprocessor for processing hourly surface observations
- PMERGE – a meteorological preprocessor for reformatting the precipitation data
- MAKEGEO – a preprocessor reading land use, terrain data, user inputs and surface parameters and producing a file ready for CALMET
- CALSUM – a postprocessor summing and scaling concentrations or wet/dry fluxes
- APPEND – a postprocessor appending two or more sequential CALPUFF concentration, wet/dry flux, or relative humidity (visibility) files in time
- POSTUTIL – a postprocessor merging species, summing and scaling results from different runs, adding background, and repartitioning nitric acid/nitrate

Parameter	Value	Unit
parameter for running all periods in	0	
ig year of the run	2009	
ig month of the run	1	
ig day of the run	7	
ig hour of the run	1	
h of the run	96	
lase zone	-3	
ontrol	0	
er of periods in restart output cycle	0	
restart file written during run	SO15S1.RST	
options for regulatory values	0	
ig downwash method	1	

12 item(s)

Parameter	Description	Value	Unit
Run type		1	
Flag to compute special data fields required by CALGRID in addition to regular fields		0	
egulatory check		0	
No observation mode		0	
Base time zone		0	
Length of run		1	
Map projection for all XY coordinates		UTM	
False Easting		0	
False Northing		0	
UTM zone		0	
Hemisphere for UTM projection		N	
Datum-region for output coordinates		WGS-84	
Absolute value of Coriolis parameter		1.E-4	1/s
Spatial averaging of mixing heights		1	
Upwind averaging layer		1	
Maximum search distance (grid cells)		1	
Half-angle of upwind looking cone		30	
Minimum potential temperature lapse rate		0.001	K/m
Depth of layer above current mixing height		200	meters
Minimum overland mixing height		50	meters
Maximum overland mixing height		3000	meters
Minimum overwater mixing height		50	meters
Maximum overwater mixing height		3000	meters

Integration with Breeze 3D Analyst

BREEZE 3D Analyst is a powerful post-processor that enables you to analyze and visualize data in time series, contour plots, and 3D isosurface and plane views; and to visualize the intersection / union of multiple data sets. It is useful for analyzing meteorological, terrain, and concentration data. Animated movies can be created

for display in presentations and it is compatible with Golden Software's Surfer application and Google Earth.

The plotting and graphing features in 3D Analyst allow you to create great-looking plots of modeling results and raw datasets so that you can quickly analyze the data in both two and three dimensions. With BREEZE 3D Analyst, you can:

- Create custom contour levels for an entire project or individual datasets
- Customize all object properties to display only the results and objects you want to see
- View data from every angle with 2D plane views, 3D surfaces, and slices of 3D data in the XY, XZ, and YZ planes
- Plot data as a function of time and animate the time steps
- Use your mouse to view real-time data interpolation between receptors
- Plot data to Golden Software's Surfer application and Google Earth
- Create 3D templates that can be loaded with future projects to quickly recreate three dimensional display views

Not only can you display data, BREEZE 3D Analyst allows users to perform data manipulation simultaneously. Temporarily transform data with easy-to-use scaling and transformation tools to analyze how your results could change. You can also use the numerous tools to extract averages, percentiles, highs, and more all from a single dataset.

Buildings

CALPUFF takes into account the obstruction of wind flow from structures, such as buildings and point sources (i.e., stacks). Like any other model object in BREEZE CALPUFF, buildings can be copied and pasted or drawn into the 2 D display. Building information can be processed by the embedded U.S. EPA BPIP EPA BPIP program.

BREEZE CALPUFF offers you the ability to create rectangular, circular, and polygon buildings. A simple building mode is an exclusive feature of BREEZE that eliminates the error prone requirement of assigning "tier levels" to each and every structure.

Sources

BREEZE CALPUFF allows you to model point, area, volume, and line sources. At least one source must be defined. BREEZE offers object array generators that create user defined arrays (e.g., polylines, polygons, and Cartesian grids) of the model object type.

BREEZE CALPUFF source option allows you to specify entry units for point, line, area, and volume sources, line source parameters (e.g. buoyancy parameter), external emissions and boundary source files.

Receptors

Receptors are locations where BREEZE CALPUFF will compute a concentration or deposition value. At least one receptor must be defined. BREEZE CALPUFF offers you the ability to create discrete, gridded, and polygon arrays. BREEZE also has the exclusive ability to generate variable density and 3D gridded networks.

BREEZE CALPUFF allows you to set the physical characteristics of hills including the location, size, and height, as well as further associate complex receptors with hills.

Complex Receptor - YFYUT00A

Complex Receptor Data

Description/location		Complex receptor	
ID	YFYUT00A	YFYUT00A	
Description			
X coordinate	248.9403 km		
Y coordinate	4772.401 km	Parameters	
Elevation	500 meters	Hill ID	YFYUT000
		<input type="checkbox"/> Sensitive receptor	YFYUT000 YFYUT001 YFYUT002

Scenario Development Tools

BREEZE CALPUFF provides a variety of utilities to facilitate model setup or the analysis of results.

- Embedded Surfer (need to be pre-installed) link in BREEZE MAKEGEO
- Coordinate Converter to convert one coordinate to another
- A tool to blank on-site or off-site receptors
- Data Explorer to provide means of viewing project data in a Windows Explorer-like fashion. It is also referred to as Spreadsheet or Table view because model object data can be viewed, added, removed, and edited from within this view much like today's standard spreadsheet applications
- Map window to import DXF file, shape file, or base map image and to visualize model objects
- 3D window to view buildings and terrain
- Access to BREEZE support and get help from AERMOD experts

Requirements

Hardware

- Intel or AMD processor, 32 or 64 bit. 500-megahertz (Mhz) or higher
- 256 megabytes (MB) RAM, 512 MB RAM recommended
- 2 gigabyte (GB) available disk space
- 1024 x 768 minimum display resolution
- Mouse or other pointing device

Software

- Windows XP, Windows Vista, Windows 7, Windows 8, Windows Server 2003, Windows Server 2008 or Windows Server 2012
- Microsoft .NET Framework 2.0 or later

Additional requirements

- CALPUFF-ready model data

Maind srl è distributore unico per l'Italia dei software di Trinity Consultant.
